Microsoft

Introduction to Azure SQL Database

Module 1

Learning Units covered in this Module

- Lesson 1: Basic concepts of Azure SQL Database

- Lesson 2: How to create Azure SQL Database

- Lesson 3: Introduction to Elastic Database Pools

Lesson 1: Basic concepts of Azure SQL Database

Objectives

After completing this learning, you will be able to:

· Describe the basic concept and architecture

· Describe the difference between SQL Server IaaS and PaaS Solutions

· Describe the difference between the purchase models.

· Describe the service tiers compute and hardware generation of the Azure SQL.

· Describe the difference between Provisioned vs Serverless.

What is Microsoft Azure?
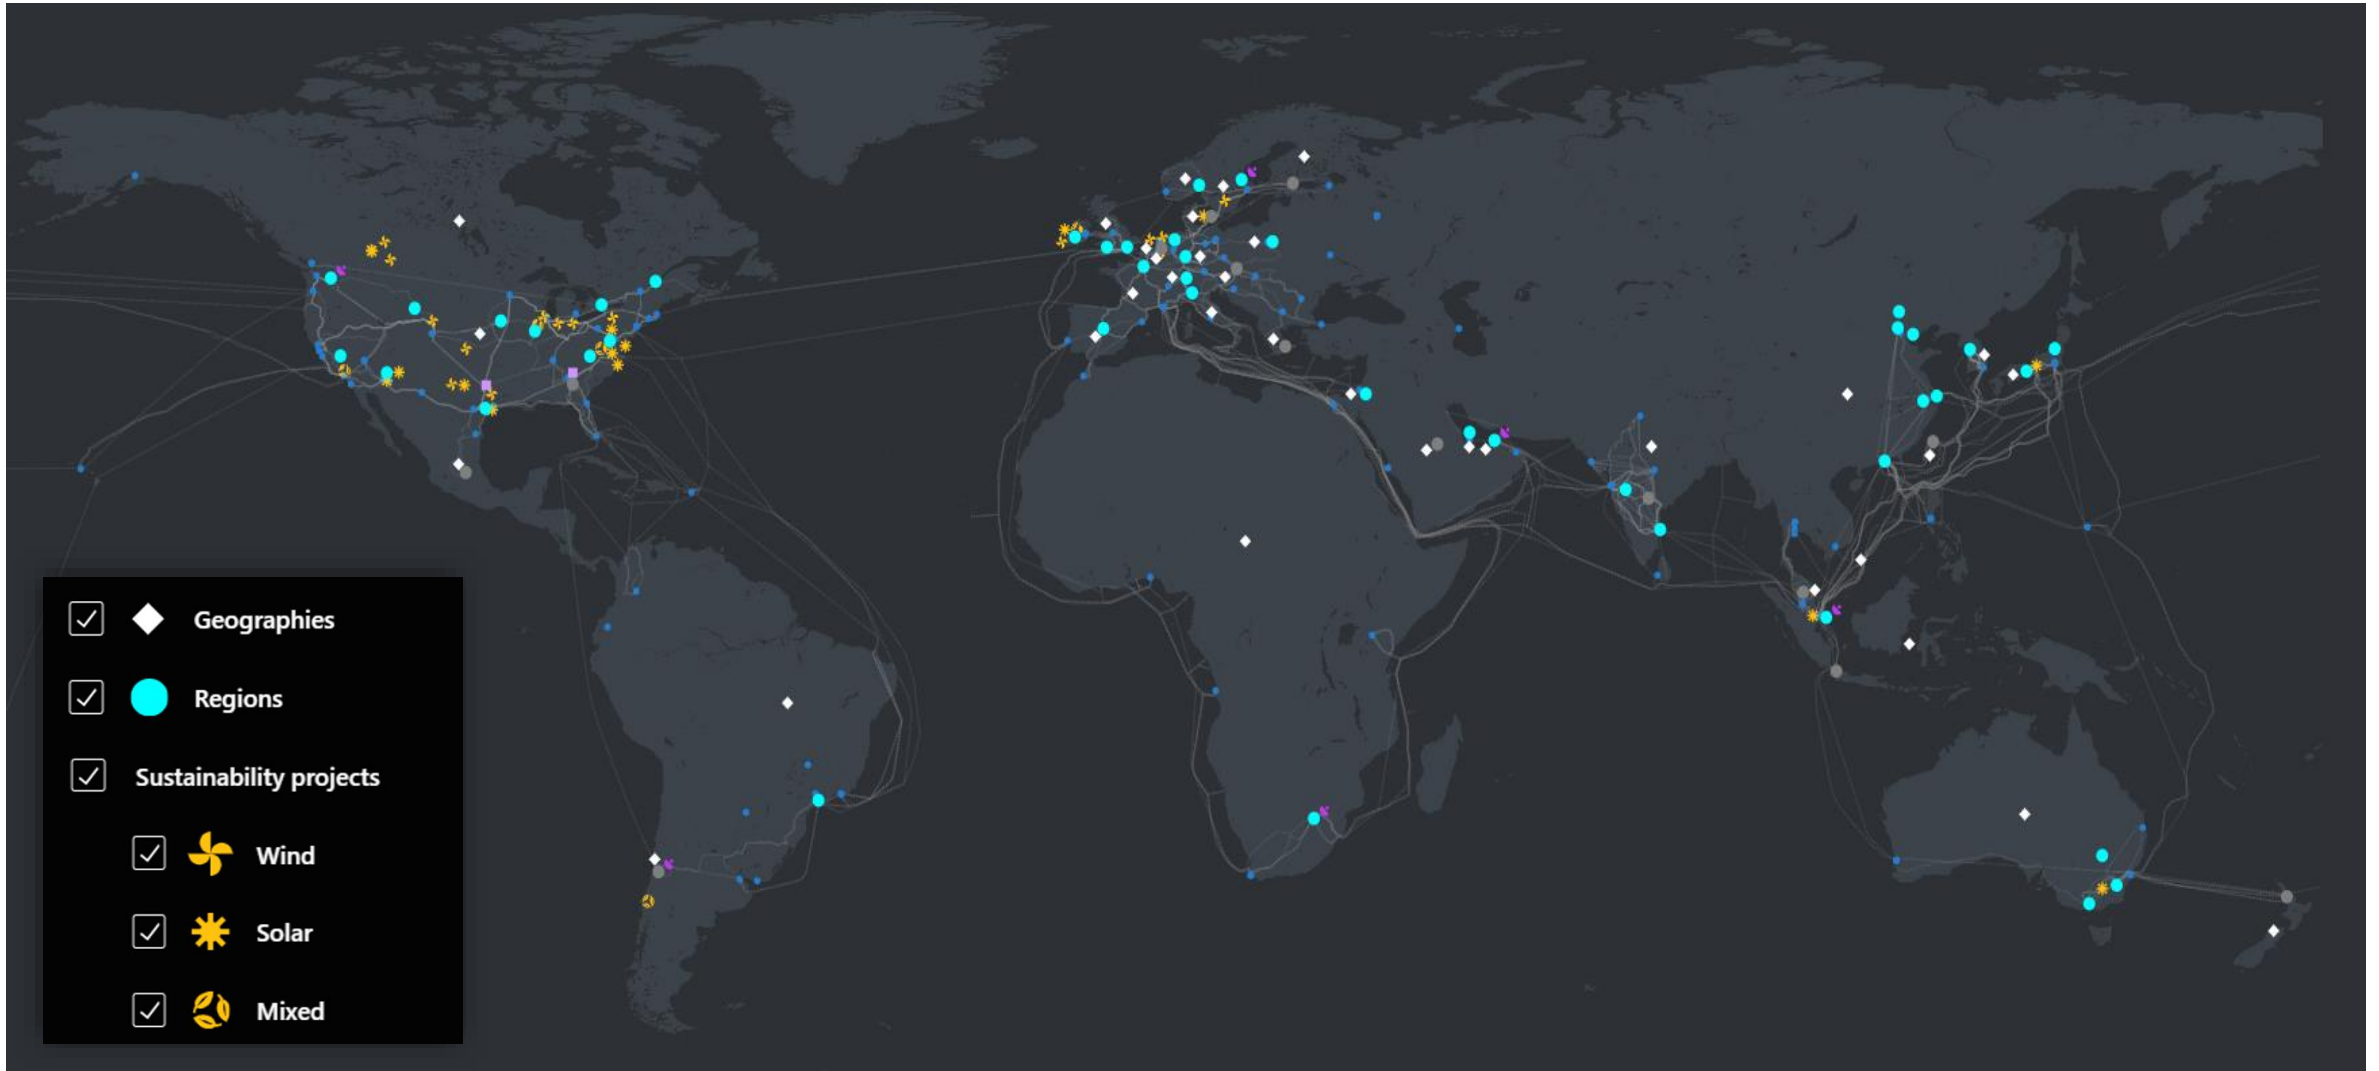

[Azure global infrastructure experience (microsoft.com)](https://microsoft.com)
Cloud Hosting Models

| Managed by customer | Managed by Microsoft |

**On-premises costs** tend to be driven by hardware and data center management costs

Infrastructure-as-a-Service reduces cost categories related to data center and compute

Platform-as-a-Service off-loads customers' most administrative tasks to Azure, further improving efficiency with machine-learning capabilities for performance and security
- **Managed Instance**: instance-level deployment for lift-shift existing apps to Azure, fully backward compatible

- **Single database**: database-level deployment for new apps

On-premises	Infrastructure (as a Service)	Platform (as a Service)
Applications	Applications	Applications
Data	Data	Data
High availability /DR/Backups	High availability /DR/Backups	High Availability/ DR/Backups
Database Provision/ Patch/Scaling	Database Provision/ Patch/Scaling	Database Provision/ Patch/Scaling
O/S provision /patching	O/S	O/S
Virtualization	Virtualization	Virtualization
Hardware	Hardware	Hardware
Datacenter Management	Datacenter Management	Datacenter Management
SQL Server 2017/2019	**Azure SQL VMs**	**Azure SQL Database**

Virtual Machine vs Managed Instance vs Azure SQL Database
What are my options?

IaaS

I want a Virtual Machine

- Azure manages the hardware
- You own the OS and SQL Server
- You own monitoring and HADR

SQL Server in Azure Virtual Machine

PaaS

I want a SQL Server

- Azure manages the hardware and OS
- You get a SQL Server, but we help you manage it
- You need SQL Server feature compatibility and low friction move

Managed Instance
Single Instance Pool

I want a database

- Azure manages the hardware, OS, and SQL Server
- Azure gives you predicable performance
- Azure provides HADR, monitoring, and intelligence

Azure SQL Database
Single Elastic Pool

Azure SQL PaaS deployment options

Azure SQL Database

Managed instances
Best for most lift-and-shift migrations to the cloud

Databases
Best for modern cloud applications. Hyperscale and serverless options are available

Single instance	Instance pool*	Single database	Elastic pool
• SQL Server surface area (vast majority). • Native virtual network support. • Fully managed service.	• Resource sharing between multiple instances to price optimize. • Simplified performance management for multiple databases. • Fully managed service.	• Hyperscale storage (up to 100TB). • Serverless compute. • Fully managed service.	• Resource sharing between multiple databases to price optimize. • Simplified performance management for multiple databases. • Fully managed service.

*Instance pool is currently in public preview, more details here

# Azure SQL Database Purchasing models and resources

Database Transaction Unit (DTU) model

- Pre-packaged, bundled unit that represents the database power.
- Designed for **predictable performance**, but somewhat inflexible and limited in options.
- DTU sizing offers simplicity of choice.
- Blended measure of CPU, memory, and read-write rates.
vCore model

- À La carte approach deconstructs the DTU model into separate parts.
- Customers can select compute and storage independently.
- Allows customers to right-size their compute requirements in the cloud.
- vCore sizing offers flexibility of choice.
- Provides a choice between a **provisioned compute tier** and a **serverless compute tier**.

DTU model
Fixed scalability

Compute

Available SLA	99.99%															
Database max. size	2 GB	250 GB		1 TB											4 TB	
Point-in-time restore ("oops" recovery)	Any point within 7 days	7-35 days (7 days by default)														
Business continuity	Active geo-replication, up to four readable secondary backups															
Security	Auditing, row-level security, dynamic data masking, Advanced Threat Protection															
Database transaction units (DTUs)	5	10	20	50	100	200	400	800	1,600	3,000	125	250	500	1,000	1,750	4,000

$ ←→ $$$

Resource limits for single databases using the DTU-based purchasing model

vCore-based purchasing model: Provisioned compute tier

Simplicity:

- We remain committed to the DTU-based model and the simplicity it offers customers who want a pre-configured solution.

Flexibility:

- The vCore-based model reflects our commitment to customer choice and to simplify the hybrid benefit for customers migrating from on-premises.

Customers pay for:

- Service tier + number of vCores.
- Type and amount of data storage.
- Number of IO.
- Backup storage (RA-GRS).

# vCore-based purchasing model: Provisioned compute tier

Service tier	General purpose		Business critical		Hyperscale
Best for	Most budget-oriented workloads		Critical business applications with high IO requirements.		VLDB OLTP and HTAP workloads with highly scalable storage and read-scale requirements.
Deployment option	Single / Elastic Pools	Managed Instance	Single / Elastic Pools	Managed Instance	Single
Compute tiers	Gen5: 2 to 80 vCore Fsv2-series*: 72 vCore Serverless: 0.5 to 16 vCore	Gen5: 4 to 80 vCore	Gen5: 2 to 80 vCore M-series*: 128 vCore	Gen5: 4 to 80 vCore	Gen5: 2 to 80 vCore
Storage	Premium remote		Local SSD		Local SSD Cache
	5GB – 4TB per instance	32GB – 16TB per instance	5GB – 4TB per instance	32GB – 16TB per instance	Scale from 5GB to 100TB of storage in 1GB increments
In-Memory	Not supported		Supported		Not supported
Read-write IO	~2ms for all data access		<0.5ms for all data access		<0.5ms for hot data access ~2ms otherwise
Availability	1 replica, no read-scale replicas		3 read replicas, zone-redundant HA	3 replicas, 1 read-scale replica, zone-redundant HA	Primary read/write replica + up to 4 read replicas
Backups	RA-GRS, 7-35 days (7 days by default)		RA-GRS, 7-35 days (7 days by default)		LRS, ZRS, RA-GRS, 7-35 days (7 days by default)

Business Critical service tier: collocated compute and storage

Hyperscale

Feature	Description
Number of vCores	Gen4: 1 to 24 vCore Gen5: 2 to 80 vCore
SQL Server version/build	SQL Server (latest available)
Additional features	4 read-scale replicas 100TB Data Support Constant Time Operations
Min storage size	4 GB
Max storage size	100TB Grows as customer data grows
Max storage per database	Determined by the max storage size per instance
Number of data files (ROWS) per the database	Multiple
Number of log files (LOG) per database	1
Managed automated backups	Yes
HA	High Availability is ensured on the storage layer
Built-in instance and database monitoring and metrics	Yes
Automatic software patching	Yes
VNet - Azure Resource Manager deployment	Yes
VNet - Classic deployment model	No
Portal support	Yes
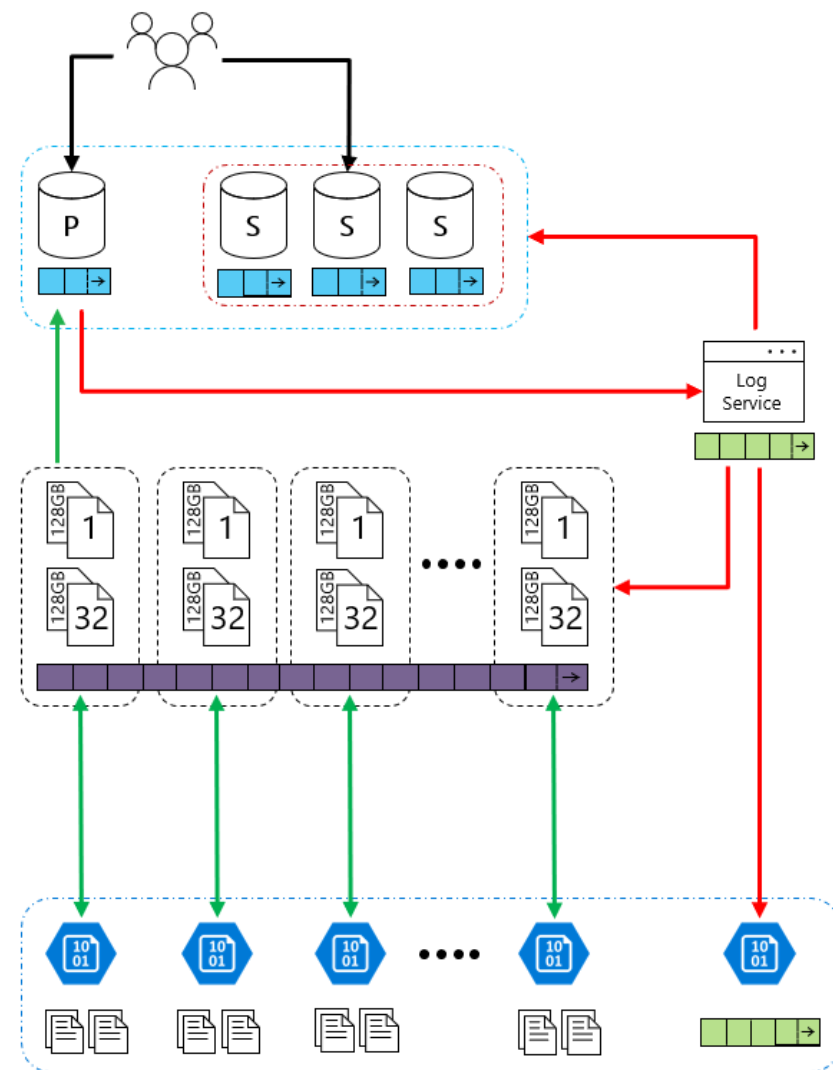

Hyperscale Service Tier – Availability of Storage

Choose from hardware generations

	Gen 5	Fsv2-series	M-series	DC-Series
Hardware	Intel E5-2673 v4 (Broadwell) 2.3 GHz processors, fast eNVM SSD vCore=1 LP (hyper-thread)	Intel Xeon Platinum 8168 (SkyLake) processors	Intel Xeon E7-8890 v3 2.5 GHz processors	Intel® XEON E-2288G processors. Featuring Intel Software Guard Extension (Intel SGX))
Performance levels	1 to 80 vCores	72 vCores (1 vCore = 1 hyper-thread)	128 vCores (1 vCore = 1 hyper-thread)	Provision up to 8 vCores (physical)
Memory	5.1 GB per vCore for provisioned compute Up to 24 GB per vCore for serverless compute	1.9 GB per vCore	29 GB per vCore	4.5 GB per vCore
Storage	Up to 4TB remote SSD storage Up to 4TB local SSD storage	Up to 4TB remote SSD storage	Up to 4TB local SSD storage	Up to 4TB remote SSD storage

- Balance performance requirements and price with two hardware generations
- Match your on-premises application behavior
- Fsv2, M, and DC series are Generally available but in limited regions
What is Azure SQL Database Hyperscale?

Storage

Scalable new storage architecture

Cloud native

Architected for cloud

Seamless compatibility

Fully compatible with Azure SQL Database

Performance

VLDB operations without VLDB headaches
No limits

Scale compute and storage
Large database

Support for 100TB+

Hyperscale is the foundation for massive app growth

Hyperscale is a new, highly scalable service tier that adapts on-demand to your workload's needs, auto-scaling up to 100TB per database.
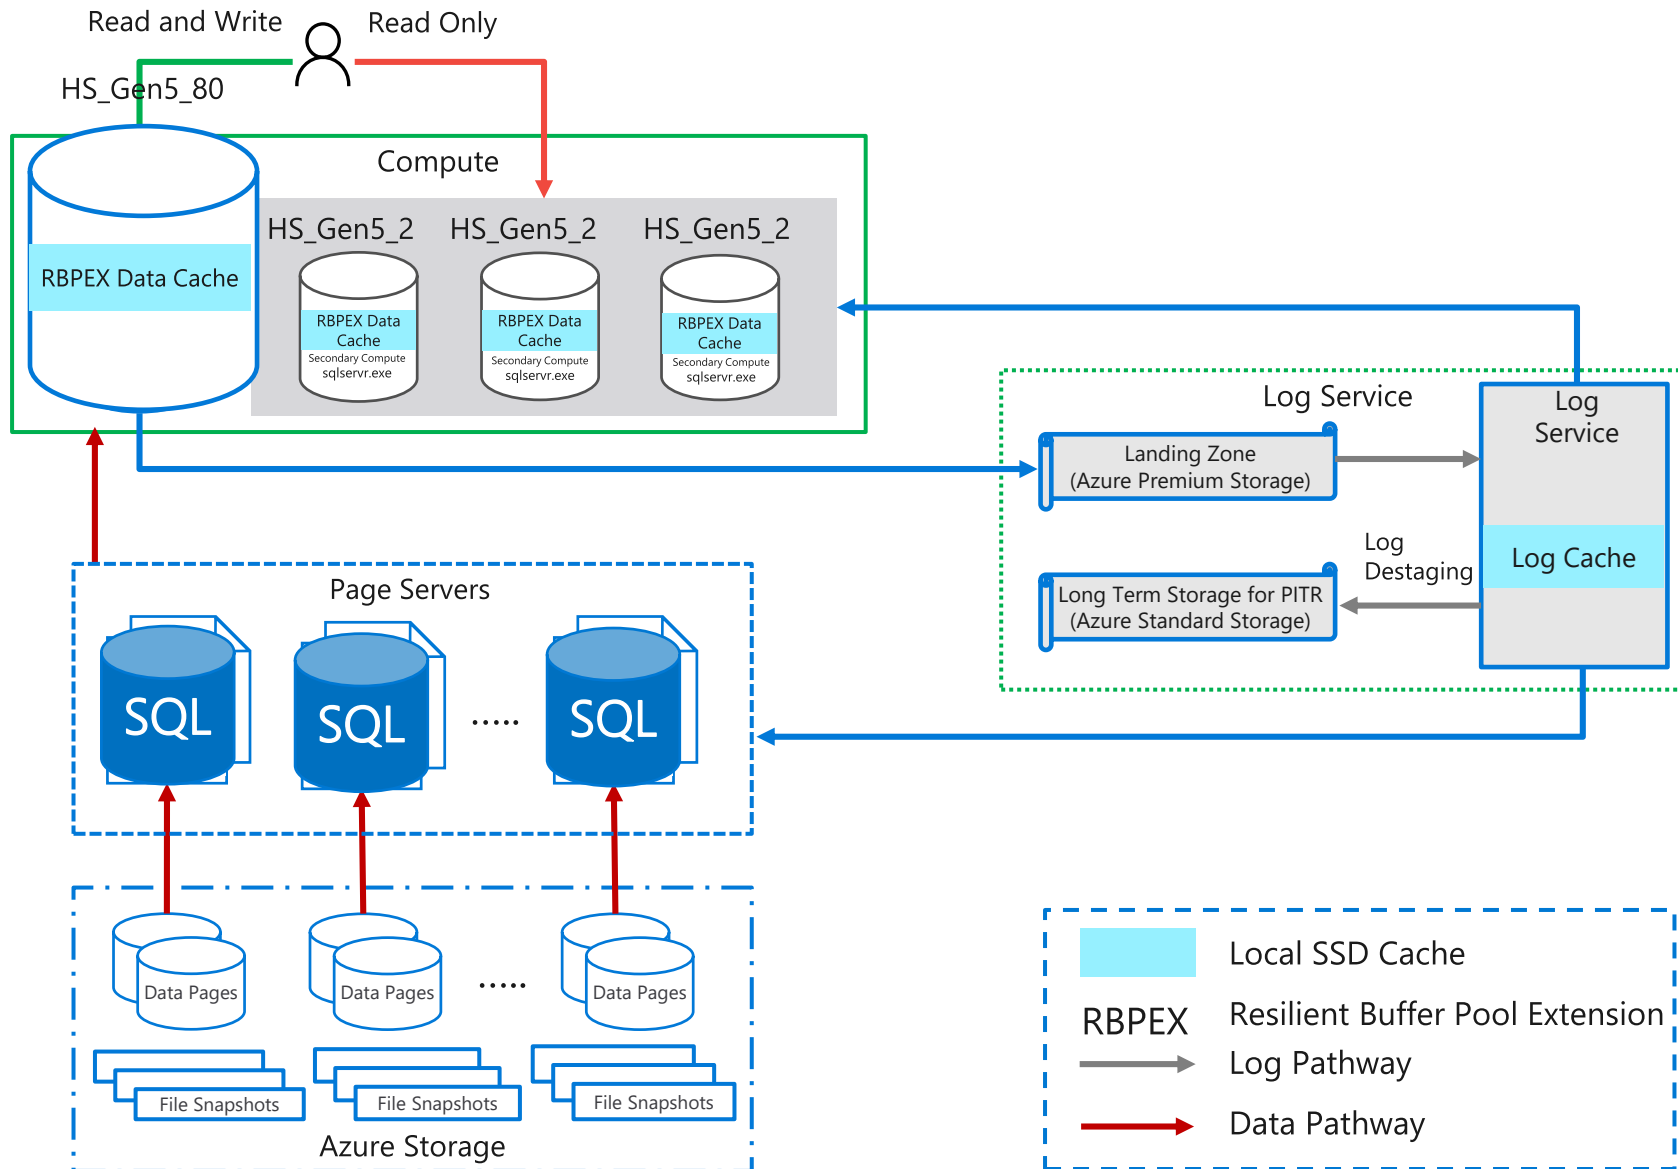

- Storage dynamically adapts to your workloads' needs, auto-scaling up to 100TB.
- Provision one or more additional compute nodes that can serve your read-only workload and use them as a hot-standby, in case of failover.
- Perform operations in constant time, regardless of the size of the data operation.
- Compute and storage resources scale rapidly and independently without sacrificing performance.

RBPEX   Resilient Buffer Pool Extension

→   Log Pathway

→   Data Pathway

Constant time scale up and down.

Offload read-only workload by adding read-scale replicas without data copy – constant time as well.

Low log commit latency - <2.5ms with Premium Storage; < 0.5ms with Ultra SSD (future improvement).

High log generation rate and fast data loading.

Page server instances work independently – infinite scale out.

Adding more page servers as your database grows – pay by usage (start with 5GB with 1GB increments).

Snapshot backup + log offloading – zero impact to compute resource.

Restore database by copying snapshots and log records – constant time point in time restore.

Checkpoints also offloaded to page servers.

What is the Hyperscale service tier? - Azure SQL Database | Microsoft Learn

vCore-based purchasing model: Serverless compute tier

On-demand flexible scale
Operate at the true rhythm of your business.

Adapts compute resources to the workload without sacrificing performance.

Automatically pauses and resumes.

Cost-effective
Pay for performance. Period.

Pay only for compute resources you consume, on a per-second basis.

Further optimize costs with configurable compute thresholds.

Fully managed & intelligent
Focus on your applications, not your infrastructure

Fully-managed and intelligent database service.

Built-in 99.99% availability.

Best for unpredictable and intermittent workloads on single databases, such as:

Dev/test   Line of Business   E-commerce

Provisioned compute and serverless meet different needs

Optimize compute provisioning and billing for your workload

Databases with provisioned compute...

Provision compute resources upfront.

Bill on an hourly basis.

Common scenarios

Workloads with regular and substantial compute utilization.

Multiple databases with bursty usage patterns that can be consolidated into a single server and use *elastic pools* for better price optimization.

Serverless databases...

Scale up or down to meet workload requirements, instead of pre-provisioning.

Bill on a per-second basis.

Common scenarios

Workloads with unpredictable and intermittent usage patterns or performance requirements .

Workloads where the requirements are unknown, and you can delegate compute sizing to the service.

Serverless price to performance with per-second billing

Compute resources scale dynamically up or down based on workload requirements.

Configure minimum and maximum vCores to define the range of available compute capacity.

Use auto-pause delay to define the time period the dataset must be inactive before pausing.

The database is automatically resumed when the next login or other activity occurs.

Pay for compute based on the vCores and memory used per second, with lowest billing based on configured vCore minimum.

When the database is paused, the compute cost is zero and only storage costs are incurred.

CPU usage

Number vCores

Inactive   Paused

— Min vcores   — Max vcores   — Vcores used | Vcores billed
Identify the right Azure SQL Database/MI SKU for your on-premises database (I/II)

Database Migration Assistant (DMA)

- Single database
- Elastic pools
- Managed instance

Identify the right Azure SQL Database/MI SKU for your on-premises database (II/II)

The feature provides recommendations related to:
- pricing tier
- compute level
- max data size
- estimated cost per month.

Furthermore offers the ability to bulk provision single databases and managed instances in Azure for all recommended databases.

Azure SQL MI SKU Recommendations

We have analyzed 3 databases. For the collection of databases, we have identified the minimum recommended Azure SQL MI SKU based off of the performance counters collected from your instances. For more detailed information about the predictions, please refer to one of the text-based output formats.

The sliders below can be used to adjust the compute level and the maximum data size for each database. After configuring the databases and entering the subscription information, click "Generate Provisioning Script" to generate a powershell script that can be used to provision the databases.

Subscription information

Subscription Id:		Resource Group:	Region: West US▾
Instance Name:		Instance Admin Username:	Instance Admin Password:
VNet Name:		SubNet Name:	

Configure Databases

Provision	Database Name(s)	Pricing Tier	Compute Level	Max Data Size	Est. Cost Per Month
☑	edw_3g, mydb, tpcds1g	General Purpose Gen 5▾	8 VCores <cost>	Max Data Size: 64 Gb <cost>	<cost>
				Total Estimated Monthly Cost	<cost>

NOTE: Price refresh failed for region West US. Prices shown are approximate. For the latest price, please consult the Azure Portal or retry with the proper authentication options enabled at a later time.

☐ I already have a SQL Server License (up to 55% savings).

Scale Compute & Storage

Create the database - Code

PowerShell:

```
New-AzSqlDatabase -ResourceGroupName "reurcegroupsqlgsps"
-ServerName "server1" -DatabaseName "database1"
-Edition "Standard" -RequestedServiceObjectiveName "S1"
```

Transact-SQL:

```
CREATE DATABASE MyFirstAzureSQLDatabase
(MAXSIZE = 500 MB, EDITION = 'standard', SERVICE_OBJECTIVE = 'S1');
```

Demonstration

Create your first Azure SQL Database

- Create a new server, configure the firewall rules and create an Azure SQL Database (DTU based).

Create an Azure SQL Database

- Exercise 1: Create a new SQL Server (logical server).

- Exercise 2: Create firewall rules.

- Exercise 3: Create an Azure SQL. Database (DTU Based).

LAB

Questions?

Knowledge Check

Why do you need to configure the Azure SQL Database Firewall and why is it important?

What options do you need to specify to create an Azure SQL Database?

What is a SQL server (logical server)?

Lesson 3: Introduction to Elastic Database Pools in Azure SQL Database

Objectives
After completing this learning, you will be able to:

· Describe the Azure Elastic Database Pool

What is an Azure SQL elastic pool?

Managing and scaling multiple databases that have varying and unpredictable usage demands.

A pool is shared by multiple databases to accommodate unpredictable periods of usage by individual databases.

Provisioning resources for the entire pool. It is a cost-effective solution for running multiple data bases with a fixed Budget.

Simply add and remove databases with downtime.

When to consider a pool?

Assessing database utilization patterns.

There are large differences between peak utilization and average utilization per database.

The peak utilization for each database occurs at different points in time.

eDTUs are shared between many databases.

DTU-based Elastic Pool service tiers

	Basic	Standard	Premium
Built for	Light transactional workloads	Medium transactional workloads	Heavy transactional workloads
Available SLA	99.99%		
eDTUs per pool	50-1,600	50-3,000	125-4,000
Max number of databases per pool	100-500	100-500	50-100
Max eDTUS choices per data bases	5	10-3000	25-4,000
Max storage per pool	5-156 GB	4 TB	4 TB
Max storage per database	2 GB	500 GB -1 TB	1 TB
Point-in-time restore ("oops" recovery)	Any point within 7 days	7-35 days (7 days by default)	
Business continuity	Active geo-replication, up to four readable secondary backups		
Security	Auditing, row-level security, dynamic data masking		
Performance objectives	Transactions per hour	Transactions per minute	Transactions per second

Elastic pool: Storage sizes and compute sizes

vCore-based Elastic Pool service tiers - General Purpose

	Gen5	Fsv2-series
vCores	2 - 80	72
Memory (GB)	10.2 - 408	136
Max number of DBs per pool	100 - 500	500
Storage type	Premium (remote) storage	Premium (remote) storage
Max data size	512 GB – 4 TB	4 TB
Max log size	154 GB – 1229 GB	1 TB
Max tempdb size	64 GB - 384 GB	333 GB
Number of replicas	1	1

Resource limits for elastic pools using the vCore-based purchasing model limits

vCore-based Elastic Pool service tiers - Business Critical

	Gen5	M-series
vCores	4 - 80	128
Memory (GB)	20.4 - 408	3767
Max number of DBs per pool	100	100
Storage type	Local SSD	Local SSD
Max data size	1 TB – 4 TB	4 TB
Max log size	307 GB – 1229 GB	2 TB
Max tempdb size	128 GB - 384 GB	4 TB
Number of replicas	4	4

Resource limits for elastic pools using the vCore-based purchasing model limits

Demonstration

Create an Elastic Pool

- Create an Elastic pool using the Azure portal
